

Gold audit: original vs blinded single-author reference vs locked model

Rows 1-3: lowest-index interior/endpoint 'trail' crops with all three masks non-empty (agreement).
Rows 4-5: lowest-index 'fp'-control crops where the model fired and the reference is empty (over-firing).
Crops selected by a fixed rule, not by eye. Reference = blinded single-author self-reannotation, not an independent gold standard.

original mask reference (blinded re-annotation) locked model (≥ 0.45)
